Symbols	vii
1 Introduction	1
1.1 Reasons for using FRP and possible applications (1.1.1 Durability of reinforced concrete – 1.1.2 Electromagnetic neutrality – 1.1.3 High strength and light weight – 1.1.4 High cuttability in temporary applications)	
2 Material characteristics	7
2.1 Types of material (2.1.1 General – 2.1.2 Fibres – 2.1.3 Polymeric matrices)	7
2.2 Typical available FRP products	14
2.3 FRP characteristics (2.3.1 General – 2.3.2 Physical properties – 2.3.3 Short term mechanical properties of FRP – 2.3.4 Long term properties of FRP)	14
3 Durability: performance and design	31
3.1 Scope	31
3.2 Introduction	31
3.3 State of the art (3.3.1 The concrete environment)	31
3.4 Durability of FRP as internal reinforcement (3.4.1 Effect of water – 3.4.2 Effects of chlorides – 3.4.3 Effects of alkali – 3.4.4 Effect of sustained stress (stress rupture) – 3.4.5 Ultraviolet radiation – 3.4.6 Thermal actions – 3.4.7 Carbonation – 3.4.8 Acid attack – 3.4.9 Concluding remarks)	32
3.5 Designing for durability (3.5.1 Existing codes and guidelines – 3.5.2 Design value of tensile strength based on residual strength tests: simplified approach – 3.5.3 Refined approach)	41
3.6 Safety factor for bond strength	50
3.7 Conclusions	51
4 Ultimate limit states for bending, compression and tension	53
4.1 General	53
4.2 Bending (4.2.1 Section properties – 4.2.2 Bending characteristics of FRP RC elements – 4.2.3 Moment resistance of FRP RC elements – 4.2.4 Compression – 4.2.5 Tension)	53
5 Serviceability Limit States	61
5.1 Introduction	61
5.2 Current code limits for SLS (5.2.1 Code limits for stresses in materials – 5.2.2 Code limits for Deflections – 5.2.3 Code limits for cracking)	61
5.3 Deflection: code models and approaches for FRP RC (5.3.1 Deflections in accordance with Eurocode 2 and CEB-FIP Model Code 1990 – 5.3.2 Deflections in accordance with ACI 440.1R-06 – 5.3.3 Deflections in accordance with ISIS Canada (2001) – 5.3.4 Deflections in accordance with CAN/CSA-S806 (2002) – 5.3.5 Deflections in accordance with the Japanese JSCE (1997) – 5.3.6 Other approaches for evaluation of deflection in FRP RC members – 5.3.7 Dimensioning for deflection control)	64
5.4 Cracking: code models and approaches for FRP RC (5.4.1 Crack width in accordance with Eurocode 2 – 5.4.2 Crack width in accordance with ACI 440.1R-06 – 5.4.3 Crack width in accordance with the Japanese JSCE (1997) – 5.4.4 Other approaches for evaluation of crack width in FRP RC members – 5.4.5 Dimensioning for crack width control)	69

6	Shear and punching shear	73
6.1	General	73
6.2	Effect of FRPs' mechanical properties on local shear carrying mechanisms (6.2.1 Shear transfer in the compression zone – 6.2.2 Aggregate interlock – 6.2.3 Dowel action of reinforcement – 6.2.4 Shear reinforcement)	73
6.3	Shear modes of failure in FRP RC elements	76
6.4	Shear design approach for FRP RC elements (6.4.1 Design principles)	77
6.5	Modifications to code design equations to allow for the use of FRP reinforcement (6.5.1 Shear in FRP RC beams – 6.5.2 Punching shear in FRP RC slabs)	78
6.6	Comments on current modifications to existing code equations	85
6.7	Detailing (6.7.1 Minimum amount of shear reinforcement – 6.7.2 Maximum spacing requirements – 6.7.3 Effect of corners on the strength of stirrups)	87
7	Bond, anchorage and tension stiffening behaviour	91
7.1	Introduction	91
7.2	Macro level bond modelling – tension stiffening effect (7.2.1 General – 7.2.2 Effect of various parameters on tension stiffening effect)	92
7.3	Meso-level modelling of bond (7.3.1 General – 7.3.2 Pull out test)	96
7.4	Splitting resistance of surrounding concrete	99
7.5	Analytical modelling (7.5.1 Local bond modelling)	99
7.6	Design rules and existing recommendations (7.6.1 Canadian Standards Association Recommendation, CSA – 7.6.2 Canadian Highway Bridge Design Code, CHBDC – 7.6.3 Japan Society for Civil Engineering (JSCE) – 7.6.4 American Concrete Institute design recommendations)	101
8	Design philosophy	107
8.1	Introduction	107
8.2	Examination of philosophy of existing guidelines	107
8.3	Design philosophy: background to a refined approach	108
Annex A	Splitting resistance of concrete	111
A.1	Introduction	111
A.2	General	111
A.3	Tests on splitting resistance of concrete (A.3.1 Pull out test with eccentrically placed bars – A.3.2 Ring pull out test – A.3.3 Overlap splice test)	112
Annex B	Background to a new design philosophy	117
B.1	Introduction	117
B.2	Examination of philosophy of existing guidelines (B.2.1 Existing design guidelines – B.2.2 Structural safety uncertainties)	117
B.3	A new design philosophy (B.3.1 Design framework based on a new philosophy – B.3.2 Application of a new design philosophy for FRP RC)	125
B.4	Application of framework for CFRP RC and GFRP RC (B.4.1 Establishment of design framework – B.4.2 Determination of appropriate γ_f – B.4.3 Design example)	127
