<b>4</b>	<b>Basis of design</b>	<b>1</b>
4.1	Structural analysis	1
4.1.1	Introduction	1
4.1.2	Elastic and time dependent analysis of linear members (Basis of the theory – Time-dependent behaviour)	1
4.1.3	Elasto-plastic analysis of linear members (Remarks on the strut-and-tie method – Slabs)	13
4.1.4	Nonlinear analysis (Basic equations - linear members – Constitutive laws for plane biaxial reinforced concrete structures within a FE-code)	25
4.1.5	Selected comments (Variable inclination of compression diagonals in shear design – Linear elastic computer codes for two-dimensional reinforced concrete members – Evaluation of the prestressing state in T-beams – Nonlinear stress ranges within in plane loaded plates – Rough estimation of creep – Torsional stiffness of statically indeterminate structures – Modelling of reinforced concrete for a nonlinear calculation)	38
4.1.6	Further considerations and updates on time dependent analysis of concrete structures (Introduction – General considerations on structural effects of creep and shrinkage – Limit states – Evaluation of time dependent effects in concrete structures in the serviceability domain; statistical nature of the problem – Prediction models for creep and shrinkage and database for their calibration – The structural analysis problem: the linear aging viscoelastic approach – Constitutive laws in linear aging viscoelasticity: integral-type creep and relaxation laws for uniaxial stress and strains – Linear aging viscoelastic solutions for effective homogeneous structures of averaged rheological properties – Linear aging viscoelastic solutions for effective homogeneous structures of averaged rheological properties with elastic (steel) redundant restraints of structural elements – Heterogeneous structures – Methods of solving the linear aging viscoelastic problem – Accurate numerical solutions as a sequence of elasticity problems with initial strains – Conversion to algebraic expressions: Age-Adjusted Effective Modulus (AAEM) method – Guidelines for design – Design aids)	43
4.2	Design format	70
4.2.1	Definition of limit states	70

4.2.2	Safety concept	71
	(Theoretical background – Frequently used distribution functions – Failure probability and reliability index – Relation between reliability index and safety factors – Determination of failure probability – Determination of partial safety factors)	
4.2.3	Design format	85
	(General – Design format for ultimate limit state – Design format for serviceability limit state)	
4.3	Serviceability Limit States principles	90
4.3.1	General	90
4.3.2	Crack control	97
4.3.3	Deformation	133
	(Introduction – Criteria for deflection control – Basic equations for the calculation of deflections – Calculation of deflection by numerical integration – Calculation of the deflection of indeterminate beams by numerical integration – Long term deflections – Accuracy of deflection calculations – Simplifications to the calculation of deflections – Span/depth ratios – Deformations and stresses due to temperature change)	
4.4	Ultimate Limit State principles	171
4.4.1	Basic design for moment, shear and torsion	171
	(Purpose and place of ultimate limit state design – Structural modelling – Limiting stresses for static design – Axial load and flexure – Combined shear and flexure – Torsion – Plates and slabs)	
4.4.2	ULS of buckling	250
	(Introduction – Reduction of capacity – Effects of prestressing – Effects of restraints – Slenderness limits – Analysis – Safety – Detailing)	
4.4.3	Fatigue	266
	(Problem statement – Fatigue verification in CEB-FIP Model Code 1990 – Stress calculations under cyclic loads – Fatigue resistance of steel and concrete – Application example)	
4.4.4	Nodes	281
	(Introduction to the design of nodes – Principles for the verification of singular nodes and anchorage – Typical nodes – References and indication of numerical examples)	
4.5	Anchorage and detailing principles	301
4.5.1	Reasons and background for detailing rules	301

4.5.2	Arrangement of reinforcement	301
	(Minimum concrete cover – Spacers – Single bar spacing – Bundled bars spacing – Skin reinforcement for large concrete covers and thick or bundled bars – Allowable mandrel diameter – Minimum reinforcement ratio)	
4.5.3	Anchorage regions	306
	(Anchorage of reinforcing steel – Anchorage of prestressing reinforcement – Anchoring devices)	
4.5.4	Detailing of tensile bending reinforcement	312
	(Envelope line of the tensile force and the load balancing mechanism in members subjected to bending and shear – Anchorage out of support – Anchorage over support – Distribution of the reinforcement in the cross-section of box girders or T-beams)	
4.5.5	Splices in structural members	314
	(Lap splices in tension – Lap splices in compression – Lap splices of welded fabrics – Splices by welding – Splices by mechanical devices – Lap splices of bundled bars)	
4.5.6	Detailing of shear reinforcement	326
	(Efficiency of anchorage of shear reinforcement – Distribution of shear reinforcement)	
4.5.7	Industrialisation of reinforcement	328
<b>Annex:</b>	<b>List of notations</b>	<b>331</b>
