<b>Preface</b>	<b>v</b>
<b>1 General</b>	<b>1</b>
1.1 Range of applicability	1
1.2 Basic considerations on modelling	2
<b>2 Classification by strength</b>	<b>3</b>
<b>3 Classification by density</b>	<b>5</b>
<b>4 Compressive strength</b>	<b>6</b>
<b>5 Tensile strength and fracture properties</b>	<b>10</b>
5.1 Tensile strength	10
5.1.1 Parameters affecting tensile strength	10
5.1.2 Constitutive relations between tensile strength and compressive strengths	11
5.1.3 Effect of the test methods on the obtained tensile strength	12
5.2 Fracture energy	16
5.2.1 Parameters affecting fracture energy	16
5.2.2 Relations between fracture energy and compressive strength	18
<b>6 Strength under multiaxial states of stress</b>	<b>21</b>
6.1 Fracture mechanisms und failure modes	21
6.2 Fracture criterion	22
6.2.1 Fracture criterion by Ottosen (1977)	22
6.2.2 Expansion of the criterion for brittle concretes	25
6.2.3 Calibration values	26
6.3 Comparison with test results	28
<b>7 Modulus of elasticity and Poisson's ratio</b>	<b>30</b>
7.1 Modulus of elasticity $E_c$	30
7.2 Poisson's ratio $\nu$	33
<b>8 Stress-strain relations for short-term loading</b>	<b>34</b>
8.1 Compression	34
8.2 Tension	36
8.3 Multiaxial states of stress	38
8.3.1 Scales	38
8.3.2 Stress and strain	38
8.3.3 Basic terms for constitutive laws	39
8.3.4 Plasticity	41
8.3.5 Damage	43
8.3.6 Microplane	46
8.3.7 Energy and dissipation	47
8.3.8 Localization and regularization	48
8.4 Shear friction behaviour of cracks	49
8.4.1 General description of the mechanism of shear friction across cracks in concrete	49
8.4.2 Simplified constitutive relations for aggregate interlock	51
8.4.3 Aggregate interlock under non-static loading conditions	52
<b>9 Time effects</b>	<b>54</b>
9.1 Development of strength over time	54
9.1.1 Compressive strength	54
9.1.2 Tensile strength	56

9.2	Strength under sustained loads	57
9.2.1	Sustained compressive strength	57
9.2.2	Sustained tensile strength	60
9.3	Development of modulus of elasticity over time	61
9.4	Time-dependent deformations	62
9.4.1	Definitions	62
9.4.2	Shrinkage	64
9.4.3	Creep	75
<b>10</b>	<b>Temperature effects</b>	<b>100</b>
10.1	Maturity	100
10.2	Thermal expansion	102
10.3	Compressive strength	103
10.4	Tensile strength	107
10.5	Fracture energy	109
10.6	Modulus of elasticity	109
10.7	Creep and shrinkage	111
10.7.1	Creep	111
10.7.2	Shrinkage	113
10.8	High temperatures	115
10.9	Low temperatures (cryogenic temperature)	116
<b>11</b>	<b>Properties related to non-static loading</b>	<b>118</b>
11.1	Fatigue	118
11.1.1	Introduction	118
11.1.2	Fatigue design concept – General aspects	118
11.1.3	Background information concerning the new fatigue design model	120
11.2	Stress and strain rate effects – Impact	125
11.2.1	Range of applicability	125
11.2.2	Compressive strength	125
11.2.3	Tensile strength and fracture properties	126
11.2.4	Modulus of elasticity	126
11.2.5	Stress-strain relations	126
<b>12</b>	<b>Transport of liquids and gases in hardened concrete</b>	<b>130</b>
12.1	Introduction	130
12.2	Permeation	132
12.2.1	Water permeability	132
12.2.2	Gas permeability	135
12.3	Diffusion	138
12.3.1	Diffusion of water vapour	139
12.3.2	Diffusion of gases	142
12.3.3	Diffusion of chloride ions	146
12.4	Capillary suction	150
<b>13</b>	<b>Properties related to durability</b>	<b>153</b>
13.1	General	153
13.2	Carbonation progress	153
13.3	Ingress of chlorides	158
13.4	Freeze-thaw and freeze-thaw de-icing agent degradation	161
13.5	Alkali-aggregate reaction	161
13.6	Degradation by acids	162
13.7	Leaching progress	165
<b>14</b>	<b>References</b>	<b>168</b>
