Contents

Preface i

1. Introduction 1

2. Scope 2

3. Notation 3

4. Phenomenological study of restraint moments over the piers 4

5. Long-term constitutive equations (aging factor approach) 5

5.1 Stress-strain-time relationship 5

5.2 Constant stress 5

5.3 Variable Stress 6

5.4 Effective elastic modulus 7

6. Estimation of the continuity forces 8

6.1 Restraint moments due to creep 8

6.1.1 Girder self-weight, prestressing, and slab self-weight 8

6.1.2 Prestress losses 11

6.2 Effects of deck shrinkage and temperature gradient 12

6.2.1 Differential shrinkage between the girder and the slab 12

6.2.2 Temperature gradient 13

6.3 Superimposed Dead load 13

7. Design of bottom continuity reinforcement 14

8. Parametric study 15

8.1 Parametric analysis of effects of random variability time and materials properties 15

9. Examples 17

9.1 Example 1 17

9.1.1 Description 17

9.1.2 Design specifications. 17

9.1.3 Bridge data 17

9.1.4 Estimated bending moment over piers 19

9.1.5 Determination of the reinforcement in the bottom flange of the continuity diaphragm 22

9.1.6 Detail adopted over the pier 23

9.2 Example 2 23
9.2.1 Description 23
9.2.2 Design code 24
9.2.3 Bridge data 24
9.2.4 Estimated bending moment over piers 26
9.2.6 Detail adopted over the pier 28
9.2.5 Determination of the reinforcement in the bottom flange of the continuity diaphragm 28
9.3 Example 3 29
9.3.1 Description 29
9.3.2 Design code 30
9.3.2 Bridge data 30
9.3.4 Estimated bending moment over piers 31
9.3.5 Determination of the reinforcement in the bottom flange of the continuity diaphragm 33
9.3.6 Detail adopted over the pier 33
10. References 34
11. Bibliography 37
